Retail Store Sales Insights and Prediction Model-Phase 1

1. Introduction

This project focuses on analyzing retail store sales data to uncover patterns, trends, and insights that can support data-driven business decision-making. The analysis involves data cleaning, exploratory data analysis (EDA), and visualization of key metrics such as sales, profit, customer segments, and discount impact.

2. Dataset Description

The dataset used for this project was sourced from Kaggle, as no dataset was provided by the team. It contains detailed information about retail transactions, including attributes such as Order Date, Product Category, Sub-Category, Sales, Profit, Quantity, Region, Discount, and Customer Segment.

The dataset includes both numerical variables (e.g., Sales, Profit, Quantity, Discount) and categorical variables (e.g., Category, Region, Segment), making it suitable for performing comprehensive exploratory data analysis and deriving meaningful business insights.

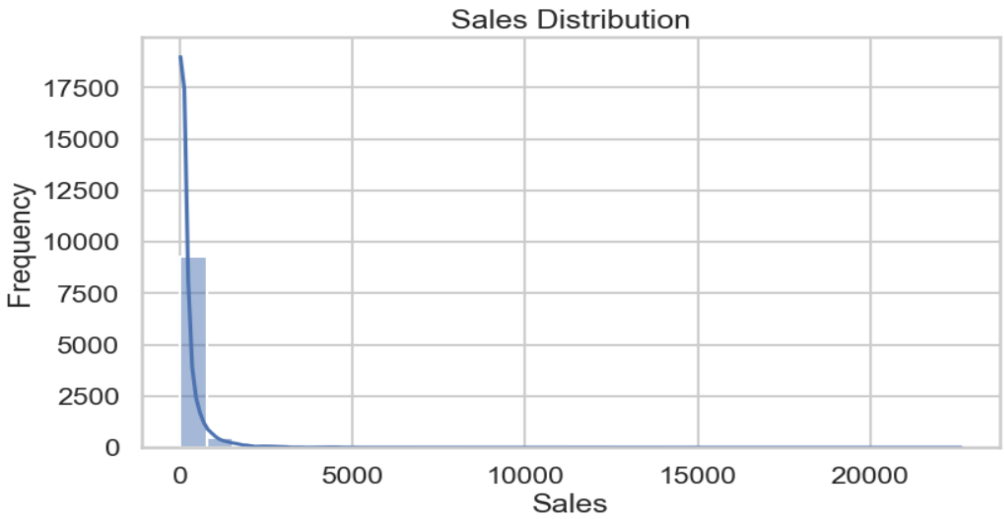
3. Data Cleaning

- Removed duplicate records to ensure data consistency
- Handled missing values appropriately
- Converted date columns into datetime format
- Standardized column names for better readability
- Created new features such as Year and Month
- Created a new feature called Profit Ratio

4. Exploratory Data Analysis

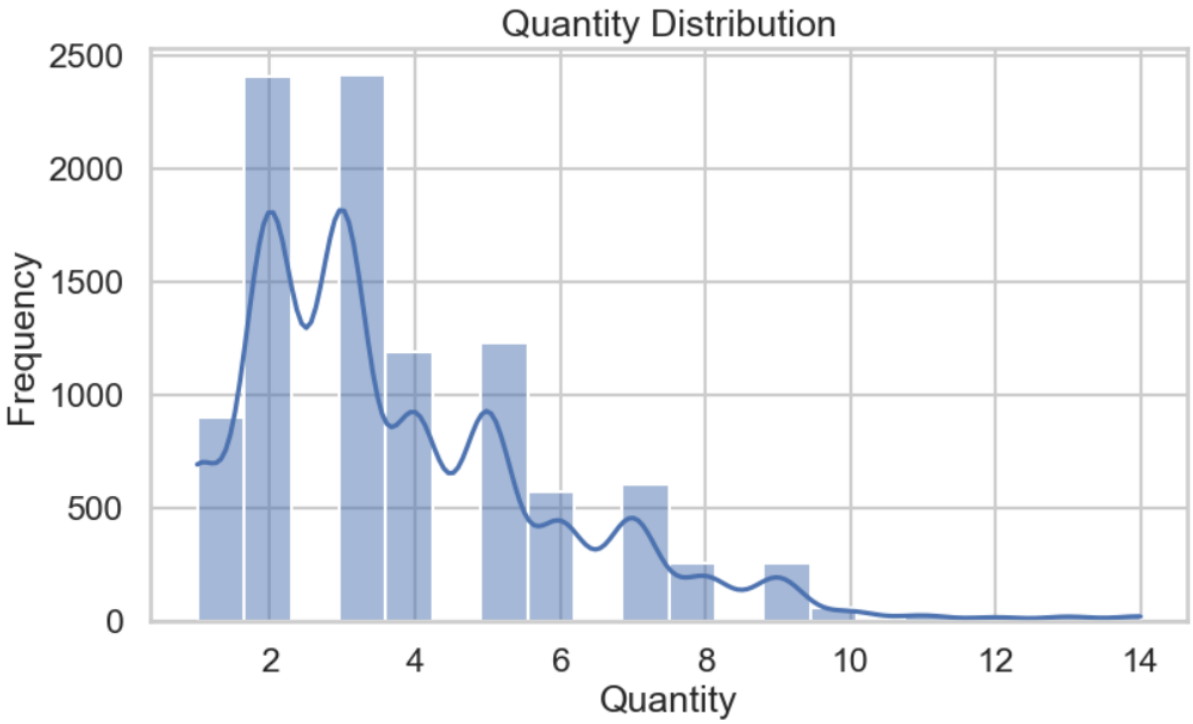
4.1 Sales Distribution

A histogram was used to analyze the distribution of sales values. It was observed that most transactions involve lower sales amounts, with a few high-value transactions, indicating a right-skewed distribution.



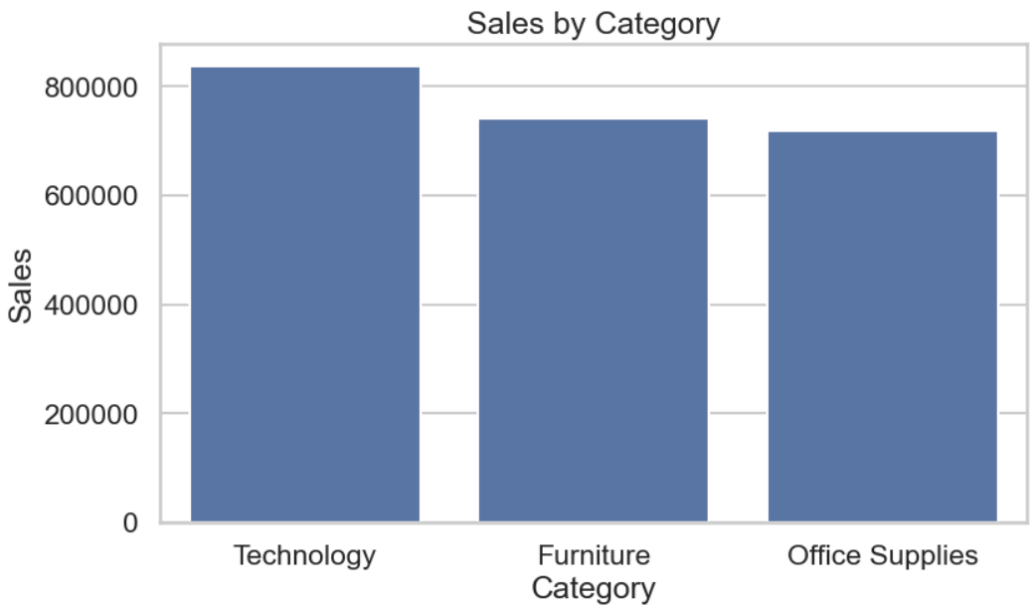
4.2 Quantity Distribution

The distribution of quantity sold per transaction was analyzed, showing that most orders consist of a small number of items.



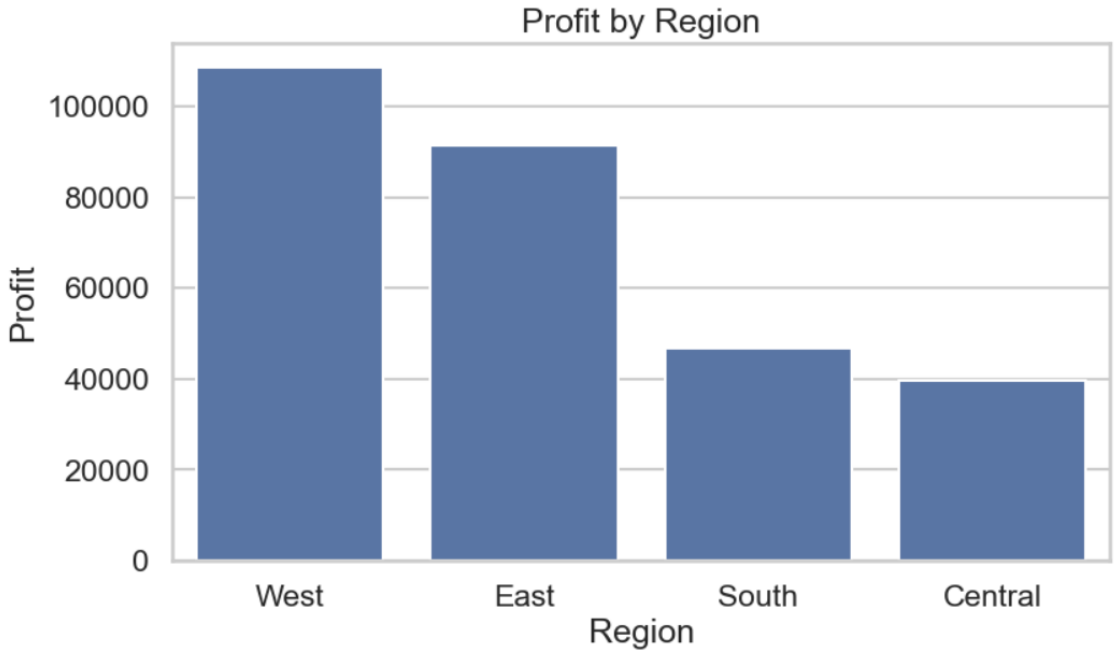
4.3 Category-wise Sales Analysis

The analysis revealed that the Technology category generates the highest sales among all product categories, making it a key contributor to overall revenue.



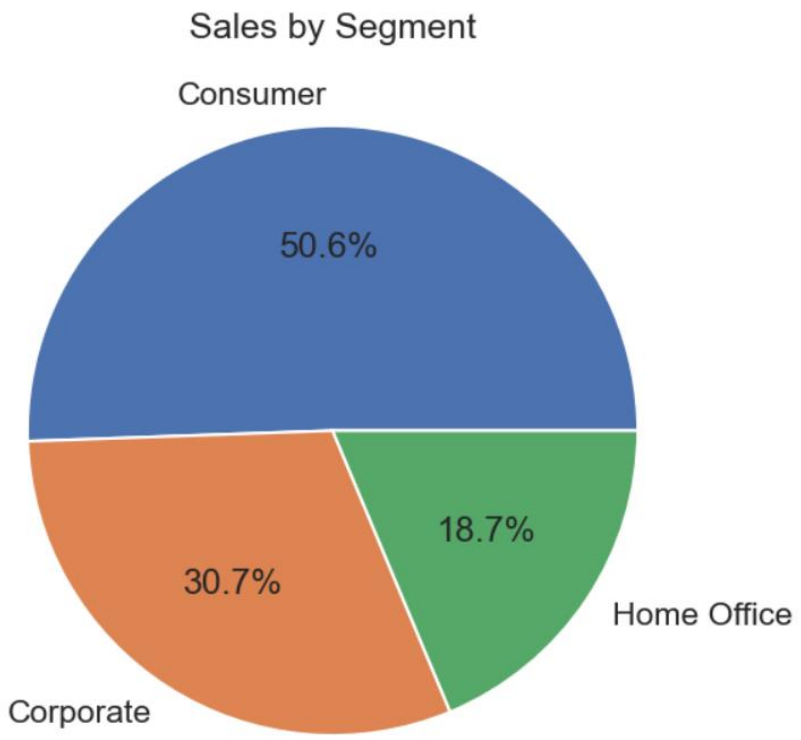
4.4 Region-wise Profit Analysis

The West region contributes the highest profit, indicating strong business performance in that region compared to others.



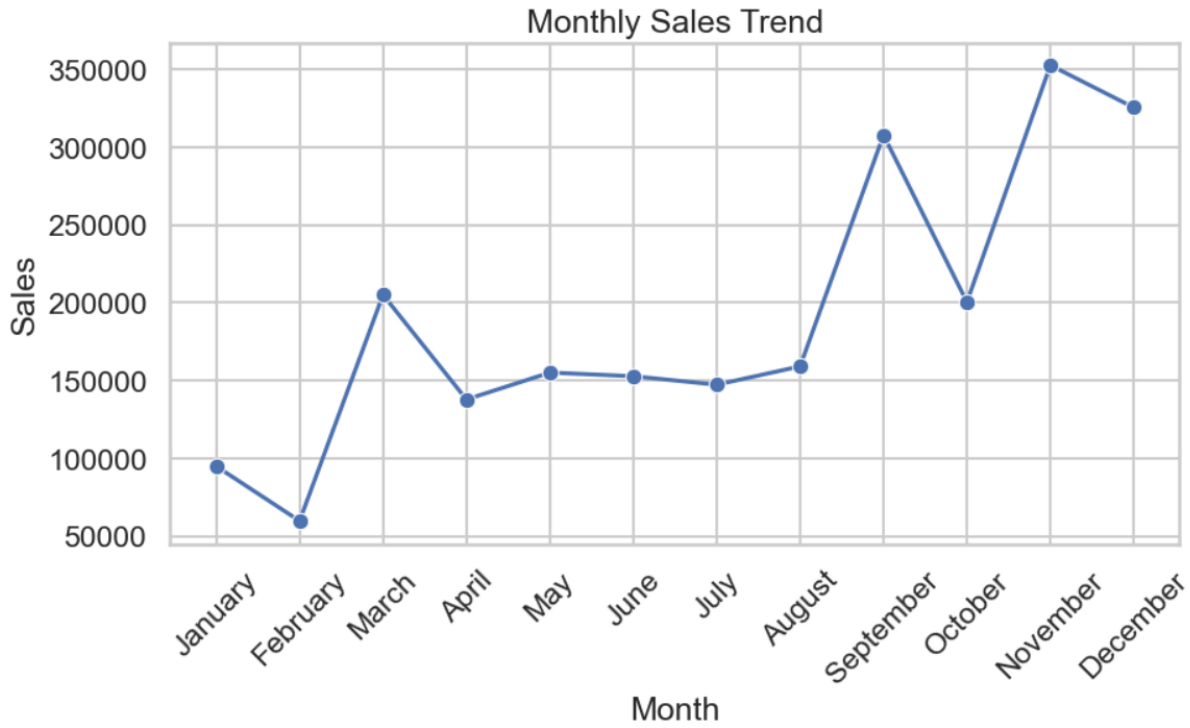
4.5 Customer Segment Analysis

The Consumer segment contributes the largest share of total sales, followed by Corporate and Home Office segments.



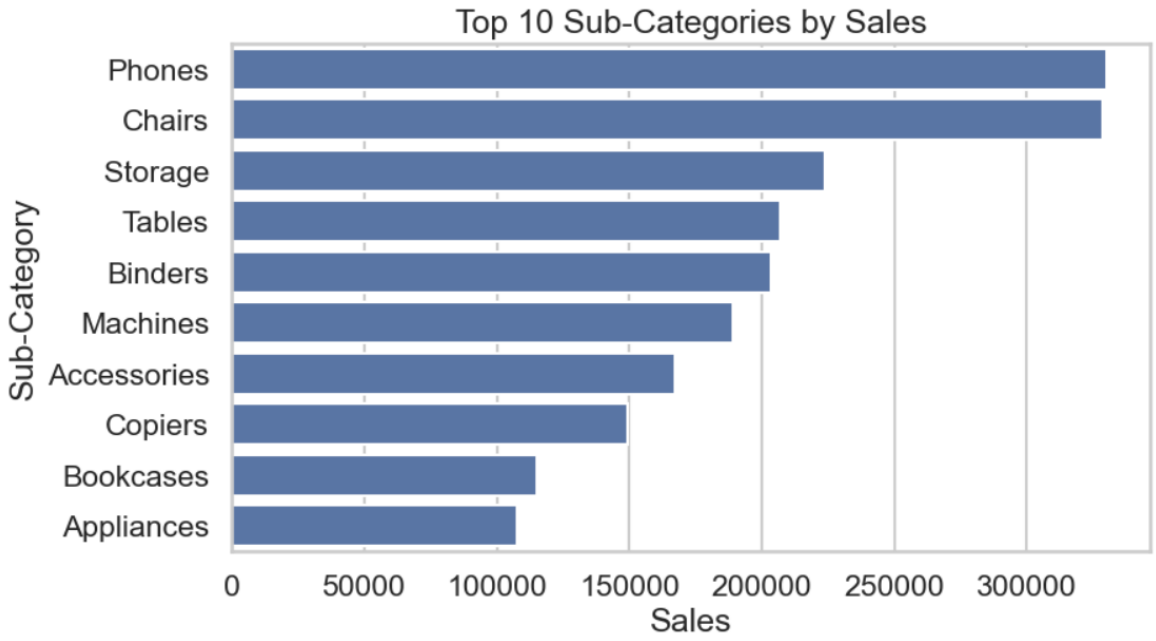
4.6 Monthly Sales Trend Analysis

Time-series analysis indicates seasonal variations in sales, with certain months showing peak performance.



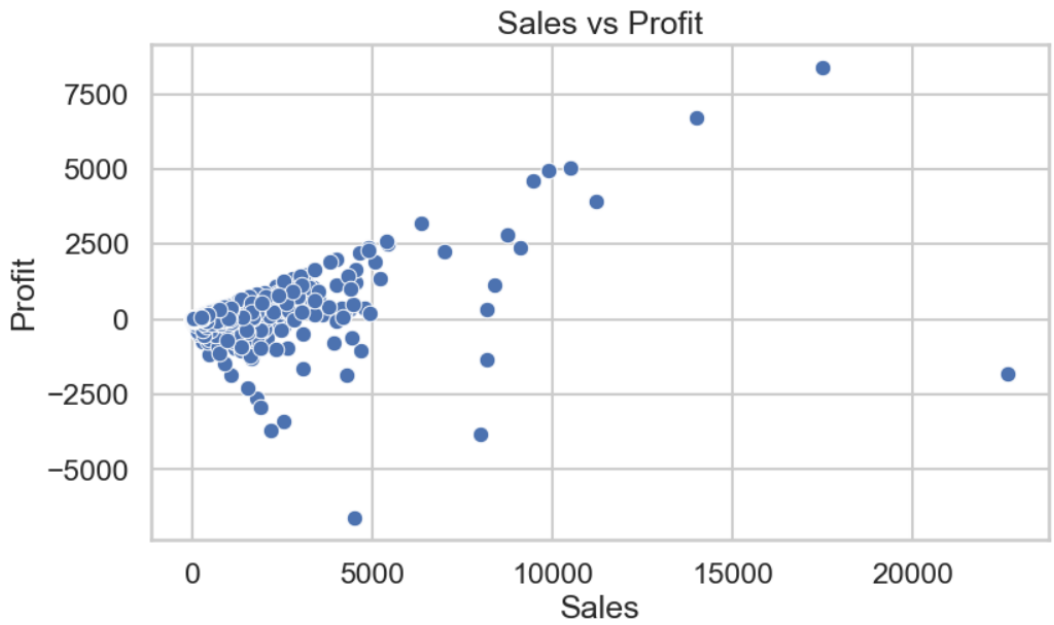
4.7 Top Sub-Categories by Sales

The top-performing sub-categories contribute significantly to total sales and represent high-demand product segments.



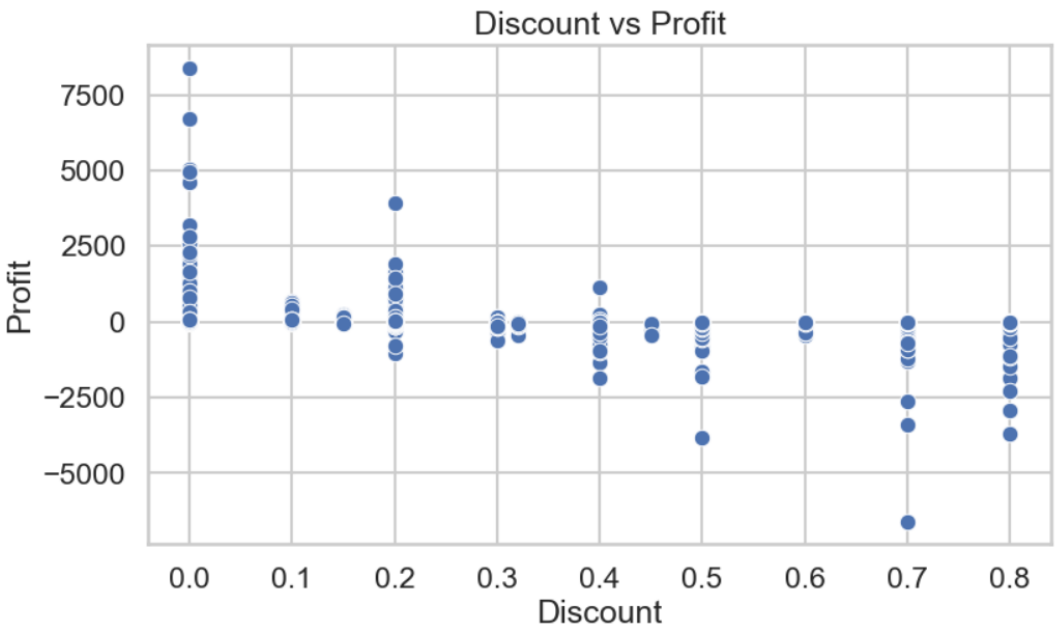
4.8 Sales vs Profit Relationship

A positive relationship between sales and profit is observed. However, some high-sales transactions result in low or negative profit, indicating the influence of discounts or cost factors.



4.9 Discount vs Profit Analysis

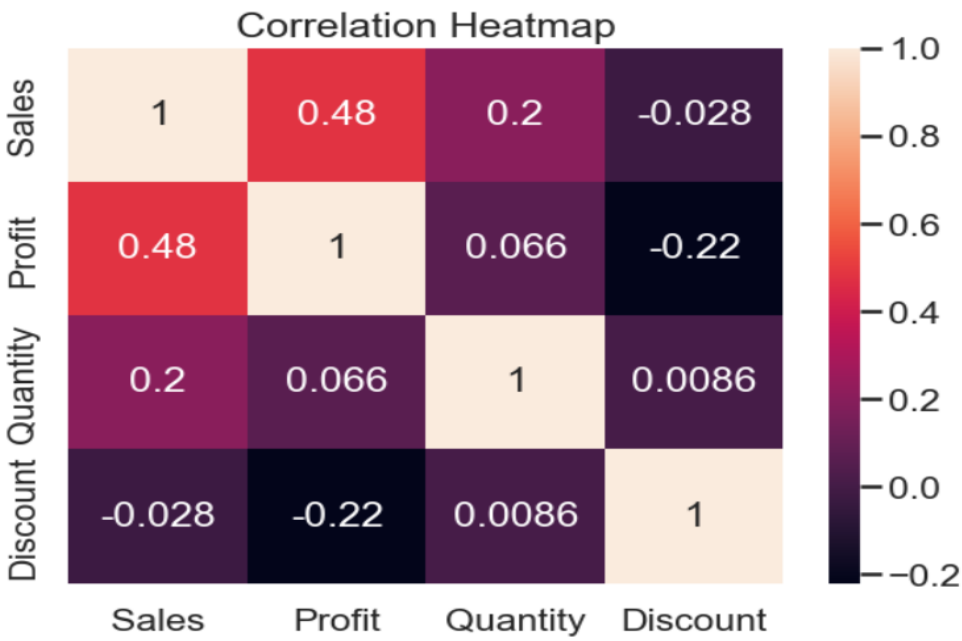
A negative relationship between discount and profit is observed. Higher discounts often lead to reduced profitability and sometimes losses.



4.10 Correlation Analysis

The correlation heatmap shows that:

- Sales and Profit are positively correlated
- Discount negatively impacts Profit
- Quantity has a weaker relationship with Profit

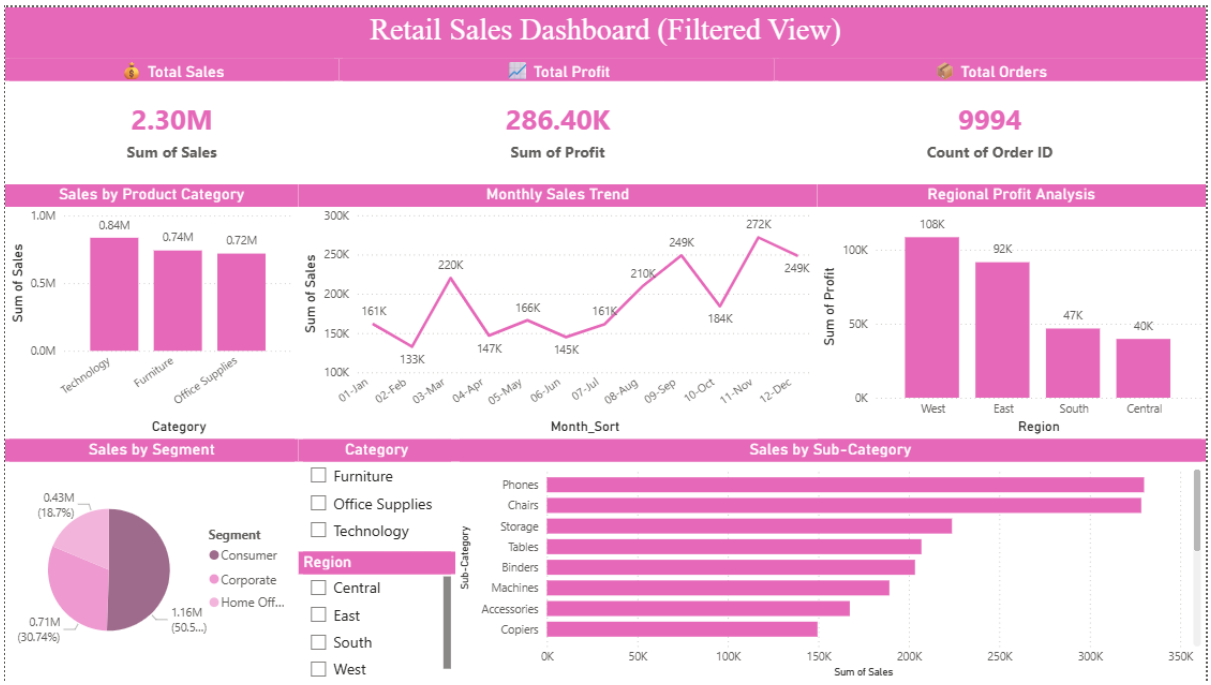


4.11 Dashboard Visualization

An interactive dashboard was developed using Power BI to provide a comprehensive overview of retail sales performance. The dashboard integrates key metrics and visualizations to enable better understanding of business trends and support data-driven decision-making.

The dashboard includes key performance indicators such as Total Sales, Total Profit, and Total Orders. It also presents visual insights through charts such as sales by category, profit by region, monthly sales trends, customer segmentation, and top-performing sub-categories.

Interactive filters (slicers) for category and region allow users to dynamically explore the data and gain deeper insights. The dashboard effectively summarizes the findings from the exploratory data analysis in a visually intuitive format.



5. Key Insights

- Technology category contributes highest revenue
- West region shows maximum profitability
- Sales show seasonal trends across months
- High discount levels significantly reduce profit margins
- Consumer segment contributes the highest share of total sales

6. Business Recommendations

- Focus on expanding Technology category products to maximize revenue
- Improve performance in underperforming regions through targeted strategies
- Optimize discount policies to avoid unnecessary profit loss
- Leverage seasonal trends for better inventory and marketing planning
- Reduce excessive discounts

7. Conclusion

The analysis provides valuable insights into sales performance, customer behavior, and profitability factors in a retail business. These findings can help organizations make informed decisions regarding pricing strategies, product focus, and market expansion. The project demonstrates the importance of data-driven analysis in improving business outcomes. The analysis demonstrates how data analytics can be effectively used to derive actionable business insights and support strategic decision-making.
